This book provides comprehensive information on Diagnostic Imaging for polytrauma patients. It provides extensive and detailed explanations of the semiotics of traumatic injuries, the correlation with the trauma's mechanism of action, and the meaning and appearance of prognostic indicators. The book begins with a discussion of the management of polytrauma patients. Particular attention is given to the role of radiology in management, and each chapter includes an assessment of the radiological findings to be used as a clinical decision-making tool. Several typical cases are shown, supplemented by a wealth of images. The book offers a useful tool both for radiologists, who will find in it a valuable guide to correctly diagnosing traumatic injuries, and for clinicians, who will come to better understand the findings of the diagnostic tests performed on their patients

This is the second edition of a superbly illustrated manual on neck dissection that will serve as a roadmap for advanced surgeons and beginners alike. The reader is guided through the various cervical structures in a series of chapters depicting the methods employed by surgeons operating in vivo. The illustrations provide an overview of all surgical anatomy relevant to the treatment of oncologic patients. Compared with the first edition, revisions have been made when appropriate and an important new chapter has been added on microscopic anatomy and laryngeal cancer. This chapter, which will also be of interest to pathologists, documents the microscopic anatomy of the larynx, presents patterns of spread and surgical options, and depicts the major surgical procedures on the larynx with the aid of numerous photographs and line drawings.

Pancreatic diseases are a crucial issue not only because of their epidemiological significance, and their anatomical and metabolic complexity, but also because of the different treatment options available and their implications for surgery. Due to the slow but steady increase in the incidence of pancreatitis and pancreatic cancer, these diseases are today a real challenge for the surgeon. This volume presents the state of the art of surgery in the treatment of inflammatory and neoplastic pancreatic diseases, describing in detail the different approaches and their most relevant technical aspects. Also described are conventional and interventional radiology, operative endoscopy and endoscopic ultrasonography (which has recently acquired a diagnostic role), and adjuvant and neoadjuvant therapy for treatment or palliation: for only a multidisciplinary approach can produce a global vision, a winning strategy for the optimization of results. Along with the texts, all written by experts, the volume includes color images and drawings. It will prove itself a very useful tool in clinical practice.

Incisional hernia surgery has witnessed important advances over recent years, not only as far as the pathophysiological and etiopathogenetic aspects are concerned, but also from a technical point of view. This book provides an update on incisional hernia surgical techniques. It includes chapters on synthetic prostheses, biomaterials and robotics. Surgeons, surgical residents, and medical students will find the information in this volume very useful in their daily practice.

Defining organs at risk is a crucial task for radiation oncologists when aiming to optimize the benefit of radiation therapy, with delivery of the maximum dose to the tumor volume while sparing healthy tissues. This book will prove an invaluable guide to the delineation of organs at risk of toxicity in patients undergoing radiotherapy. The first and second sections address the anatomy of organs at risk, discuss the pathophysiology of radiation-induced damage, and present dose constraints and methods for target volume delineation. The third section is devoted to the radiological anatomy of organs at risk as seen on typical radiotherapy planning CT scans, with a view to assisting the radiation oncologist to recognize and delineate these organs for each anatomical region – head and neck, mediastinum, abdomen, and pelvis. The book is intended both for young radiation oncologists still in training and for their senior colleagues wishing to reduce intra-institutional variations in practice and thereby to standardize the definition
