All material competely updated with the latest research results, methods, and topics now organized to facilitate logical presentation of topics New chapters on Reproductive Senescence, Conception: Gamete Transport, Fertilization, Pregnancy: Maternal Aspects and Pregnancy; Fetal Development Full color illustrations

Start your journey into the human body with cells, bones and muscles. Our resource takes you through a fascinating study of anatomy with current information. Begin with cells, the building blocks of life. Build your own cell by sculpting the different parts. Move into tissues, organs and systems to discover all the different systems that make the human body function. Next is the skeletal system. Invent your own alien skeleton using the different bones found in the human body. Understand that these bones are held together with joints and cartilage. Finally, end this part of the journey with the muscular system. Find out the difference between skeletal, smooth and cardiac muscles before identifying voluntary and involuntary muscle movement. Aligned to the Next Generation State Standards and written to Bloom's Taxonomy and STEAM initiatives, additional hands-on experiments, crossword, word search, comprehension quiz and answer key are also included.

Human reproductive cloning is an assisted reproductive technology that would be carried out with the goal of creating a newborn genetically identical to another human being. It is currently the subject of much debate around the world, involving a variety of ethical, religious, societal, scientific, and medical issues. Scientific and Medical Aspects of Human Reproductive Cloning considers the scientific and medical sides of this issue, plus ethical issues that pertain to human-subjects research. Based on experience with reproductive cloning in animals, the report concludes that human reproductive cloning would be dangerous for the woman, fetus, and newborn, and is likely to fail. The study panel did not address the issue of whether human reproductive cloning, even if it were found to be medically safe, would be à €"or would not be à €"acceptable to individuals or society.

With contributions from: Eric Blyth, Ken Daniels, Julia Feast, Robert Lee, Nina Martin, Alexina McWhinnie, Derek Morgan, Clare Murray, Sharon Pettie, Claire Potter, Jim Richards and Francoise Shenfield The separation of procreation from conception has broadened notions of parenthood and created novel dilemmas. A woman may carry a foetus derived from gametes neither or only one of which came from her or her partner; or she may carry a foetus created using in vitro fertilisation (IVF) with the purpose of handing it to two other parents one, neither or both of whom may be genetically related to the prospective child. Parents may consist of single-sex couples, only one of them genetically related to the child; the prospective mother may be past her menopause; and genetic parenthood after death is now achievable. In a world increasingly reliant on medical science, how can the argument that equates traditional with natural and novel with unnatural/unethical be justified? Should there be legislation, which is notoriously slow to change, in a field driven by dazzling new possibilities at ever faster rate; particularly when restrictions differ from country to country, so that those who can afford it travel elsewhere for their treatment of choice? Whose rights are paramount - the adults hoping to build a family or the prospective child(ren)'s future well being? On what basis can apparently competing rights be regulated or adjudicated and how and to what extent can these be enforced in practice?

This edition emphasizes the biological and biomedical aspects of human reproduction, explains the advances in reproductive science and discusses the choices and concerns in this field today. The text provides current information about human reproductive anatomy and physiology.
