Explaining how ubiquitous computing is rapidly changing our private and professional lives, *Ethical IT Innovation: A Value-Based System Design Approach* stands at the intersection of computer science, philosophy, and management and integrates theories and frameworks from all three domains. The book explores the latest thinking on computer ethics, including the normative ethical theories currently shaping the debate over the good and bad consequences of technology. It begins by making the case as to why IT professionals, managers, and engineers must consider the ethical issues when designing IT systems, and then uses a recognized system development process model as the structural baseline for subsequent chapters. For each system development phase, the author discusses: the ethical issues that must be considered, who must consider them, and how that thought process can be most productive. In this way, an 'Ethical SDLC' (System Development Life Cycle) is created. The book presents an extensive case study that applies the "Ethical SDLC" to the example of privacy protection in RFID enabled environments. It explains how privacy can be built into systems and illustrates how ethical decisions can be consciously made at each stage of development. The final chapter revisits the old debate of engineers' ethical accountability as well as the role of management. Explaining the normative theories of computer ethics, the book explores the ethical accountability of developers as well as stakeholders. It also provides questions at the end of each chapter that examine the ethical dimensions of the various

development activities.

This book deals with one of the current major debates in planning: how to measure the quality and effectiveness of the output of the planning process. It deals with issues of defining quality, public sector management, the use of indicators and the planning process. Although case study material is drawn from UK practice this topic is universal and the authors include discussions of international practice and experience.

"The General Agreement on Trade in Services (GATS) extends the multilateral trading system to services. Little is said in the GATS about subsidies, beyond stipulating that subsidies are subject to the existing provisions, including the most-favoured-nation and national-treatment principles, and that Members shall enter into negotiations with a view to developing the disciplines necessary to avoid the trade distorting effects of subsidies." "This timely book provides a comprehensive analysis of services subsidies under the GATS. It begins with a description of services and trade in services, and of the salient characteristics that make regulation of services subsidies more complex than those associated with agricultural and industrial goods. It then analyzes the economic arguments underpinning the need for regulation, as well as the need for governments to retain sufficient latitude to implement non-trade-related policy measures. A description of the information available on services subsidies is followed by a classification of services subsidies according to their distortive effects, and by a detailed analysis of those elements that may form a definition of services subsidies for the purpose of a future regulatory framework." "A key section is devoted to the analysis of those existing provisions of the GATS that may exert a certain measure of discipline on services subsidies, and to the question of the desirability and technical feasibility of countervailing measures. Rules on services subsidies contained in regional trade agreements and the need for special and differential treatment for services subsidies by developing countries are also discussed. Finally, and prior to the conclusion, two sectoral studies deal with the question of subsidies aimed at attracting foreign direct investment and subsidies to the audiovisual sector." "This work represents the first extensive and comprehensive analysis of the issue of services subsidies in the context of the GATS, and includes numerous references to relevant European Union State Aid legislation and jurisprudence." --Book Jacket.

Since the publication of the best-selling first edition of the Satellite Communication Applications Handbook, the satellite industry has experienced explosive growth thanks to a flood of innovations in consumer electronics, broadcasting, the Internet, transportation, and broadband telecommunications. This second edition covers all the latest advances in satellite technology and applications and features new

Bookmark File PDF Chapter 5 Distrting Services Through Physical And

chapters on mobile digital audio radio and VSAT networks. It updates and expands upon the engineering and management topics that made the first edition a must-have for every satellite communications professional as well as network architects. Engineers get the latest technical details into operations, architectures, and systems components. Managers are brought up to date with the latest business applications as well as regulatory and legal decisions affecting domestic and international markets. the treatment is also of value to marketing, legal, regulatory, and financial and operations professionals who must gain a clear understanding of the capabilities and issues associated with satellite space and ground facilities and services.

Subsidies are controversial media policy tools as editorial independence might be affected by those granting subsidies to newsrooms, and because they do not comply with neo-liberal market rules. This chapter shows that financial and non-financial media subsidies are widespread in the media sector. They can help overcoming temporary crises of media companies, but they are no quick fix for the structural crises news media are undergoing. Most subsidies in European countries are granted for the purpose of maintaining diversity, holding power to account, educating journalists and encouraging alternative voices. With a view to the long tradition and the strengths and weaknesses of media subsidies the author concludes by suggesting accepting media subsidies as one element in the media policy tool box.

The General Agreement on Trade in Services (GATS) is a historical agreement covering a wide range of international service transactions. In support of further trade negotiations, the Guide also highlights issues in which the business community may wish to provide input as preparations for trade negotiations move forward.

A leading young Italian semiologist scrutinizes today's cultural phenomena and finds the prevailing taste to be "neo-baroque"--characterized by an appetite for virtuosity, frantic rhythms, instability, poly-dimensionality, and change. Omar Calabrese locates a "sign of the times" in an amazing variety of literary, philosophical, artistic, musical, and architectural forms, from the Venice Biennale through the "new science" to television series, video games, and "zapping" with the remote control device from channel to channel! Calabrese admits that he begins the book with a refusal to distinguish between "Donald Duck and Dante." Avoiding hierarchies or ghettos among works, he takes his readers on a fast-paced expedition through contemporary culture that closes with an elegant essay on evaluation and classical form. According to Calabrese, the enormous quantity of narrative now being produced has led to a new situation: everything has already been said, and everything has already been written. The only way of avoiding saturation has been to turn to a poetics of repetition. The author shows that pleasure in

texts is now produced by tiny variations, and a certain kind of citation from other works has taken on a central importance that would have been unthinkable only a few years ago. In describing this development, and others shared by both avant-garde and mass media, he makes us aware of the rapid shrinkage in the once ample space between "highbrow" and "lowbrow." Originally published in 1992. The Princeton Legacy Library uses the latest print-on-demand technology to again make available previously out-of-print books from the distinguished backlist of Princeton University Press. These editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions. The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905.

Medical expenditure has become a heavy burden on the public sector and the family system in many countries. Expanding the coverage and reimbursement of medical insurance has become a common way to reduce the burden. This book will elaborate on how medical insurance may increase the burden instead. It explains why the existing medical insurance system results in increased medical costs, where higher costs may offset the benefits of certainty brought by medical insurance, forming the 'paradox of medical care insurance'. This assumption is verified by empirical evidence in China, through a new method developed to find out the actual medical costs, using two parameters: ratio of self-payment of medical insurance and the level of monopoly in the supply of medical services. The book also describes the history, the current situation, and the reform of the health care system in China.

The authors' model is the first large-scale computer simulation of the effects of changes in U.S. import quotas.
