With the development of these commercial spectrometers Infrared Spectroscopy became a more popular method to determine the "fingerprint" for any molecule. Raman spectroscopy was first observed in 1928 by Sir Chandrasekhara Venkata Raman in liquid substances and also by "Grigory Landsberg and Leonid Mandelstam in crystals".

History of spectroscopy - Wikipedia
Near-infrared spectroscopy is a spectroscopic method that uses the near-infrared region of the electromagnetic spectrum. Typical applications include medical and physiological diagnostics and research including blood sugar, pulse oximetry, functional neuroimaging, sports medicine, elite sports training, ergonomics, rehabilitation, neonatal research, brain computer interface, urology, and neurology. There are also applications in other areas as well such as pharmaceutical, food and agrochemical q

Near-infrared spectroscopy - Wikipedia
even for use in field trials with increasing progress in new technology samples in solution can infrared spectroscopy is the analysis of infrared light interacting with a molecule this can be analyzed in three ways by measuring absorption emission and reflection the main use of this technique is in organic and inorganic chemistry it is used by chemists to determine functional groups in molecules ir spectroscopy measures the vibrations of atoms and based on this it is possible to far infrared ...
