### *Chemical Engineering Thermodynamics and Reaction Kinetics ...*

Chemical kinetics is the study of chemical processes and rates of reactions. This includes the analysis of conditions that affect speed of a chemical reaction, understanding reaction mechanisms and transition states, and forming mathematical models to predict and describe a chemical reaction. The rate of a chemical reaction usually has units of  $\text{sec}^{-1}$ , however, kinetics experiments may span several minutes, hours, or even days.

In this equation,  $A_s$  is the surface area of the mineral,  $k_+$  is the intrinsic rate constant, and  $Q$  and  $K$  are the activity product and equilibrium constant for the dissolution reaction. By this equation, a mineral will precipitate when it is supersaturated and dissolve when it is undersaturated at a rate that depends on its rate constant, which you supply, and surface area.

Enzymes are protein catalysts that accelerate the rates at which reactions approach equilibrium. Enzyme kinetics is the branch of biochemistry that deals with a quantitative description of this process, mainly, how experimental variables affect reaction rates. The variables that are studied include the concentrations of the enzymes, substrates (reactants), products, inhibitors, activators, the pH, temperature, and ionic strength.
