Design Principles of MIMO Radar Detectors. Abstract: This paper considers the problem of multiple-input multiple-output (MIMO) radars employing space-time coding (STC) to achieve diversity. To this end, after briefly outlining the model of the received echo, a suitable detection structure is derived, and its performance is expressed in closed form as a function of the clutter statistical properties and of the space-time code matrix.

Radar is constructed from the words radio detection and ranging. The early purpose of a radar was to detect the presence of a target and measure its range by transmitting radio waves. Modern radars not only detect target and measure distances, but they also have the capability of locating, imaging, and identifying targets. A typical radar consists of a transmitter, an antenna, a receiver, a signal processor, and a display.

The primary goal of this chapter has been to provide a framework for evaluating the appropriateness of a particular suite of MIMO waveforms for a specific radar mission. This is necessary to decide if performance will be enhanced by using a MIMO radar instead of a traditional phased array configuration.
