Black and White version of Creo Parametric 4.0 (Part 2) (Lessons 13-22) Includes a complete set of Lectures (available on line through YouTube) for Lessons and Projects.

The purpose of Pro/ENGINEER Advanced Tutorial is to introduce users to some of the more advanced features, commands, and functions in Pro/ENGINEER Wildfire 5.0. Each lesson concentrates on a few of the major topics and the text attempts to explain the "why's" of the commands in addition to a concise step-by-step description of new command sequences. This book is suitable for a second course in Pro/ENGINEER for users who understand the features covered in Roger Toogood's Pro/ENGINEER Tutorial. The style and approach of the previous tutorial have been maintained. The material covered in this tutorial represents an overview of what is felt to be commonly used and important functions. These include customization of the working environment, advanced feature creation (sweeps, round sets, draft and tweaks, UDF's, patterns and family tables), layers, Pro/PROGRAM, and advanced drawing and assembly functions. Pro/ENGINEER Advanced Tutorial consists of eight lessons. A continuing theme throughout the lessons is the creation of parts for a medium-sized modeling project. The project consists of a small three-wheeled utility cart. Project parts are given at the end of each lesson that utilize functions presented earlier in that lesson. Final assembly is performed in the last lesson.

CREOTM PARAMETRIC 2.0 was designed in direct consultation with PTC to go hand in hand with the latest release of CreoTM Elements/Pro software, formerly known as Pro/ENGINEER. The text acts as a user friendly guide to the program walking the reader through the software and helping them to gain a better understanding of CreoTM Parametric, its assets, and uses. Step by step instructions are provided for utilizing the new capabilities and attributes of the redesigned software. Important Notice: Media content referenced within the product description or the product text may not be available in the ebook version.

The first tutorial leads you through a step-by-step process of creating a part, generating a detail drawing for the part and using Pro/NC (Pro/MANUFACTURING) to mill and machine the part's geometry.

The second tutorial involves fitting components together to form an assembly and documenting the assembly with a drawing and BOM. The last tutorial uses 2D CAD legacy design data to directly model a 3D part. Support files for all tutorials are available at www.cad-resources.com.

Designed in direct consultation with PTC to work hand-in-hand with the latest release of PTC Creo software (formerly known as Pro/ENGINEER), PTC CREO™ PARAMETRIC 3.0 provides step-by-step instructions to help readers understand the uses, assets, attributes, and new capabilities of the redesigned software. This user-friendly guide is the first book on the market on PTC Creo 3.0 and provides all the information, screen shots, and detailed illustrations necessary for effective use of the software as an engineering design tool. The book is enhanced by a free companion website featuring online lessons, online lectures, and a link to the free downloadable PTC Creo Student Edition software. The eleven lessons in this tutorial introduce you to the design capabilities of Creo Parametric 5.0. The tutorial covers the major concepts and frequently used commands required to advance from a novice to an intermediate user level. Major topics include part and assembly creation, and creation of engineering drawings. Also illustrated are the major functions that make Creo Parametric a parametric solid modeler. Although the commands are presented in a click-by-click manner, an effort has been made, in addition to showing/illustrating the command usage, to explain why certain commands are being used and the relation of feature selection and construction to the overall part design philosophy. Simply knowing where commands can be found is only half the battle. As is pointed out numerous times in the text, creating useful and effective models of parts and assemblies requires advance planning and forethought. Moreover, since error recovery is an important skill, considerable time is spent exploring the created models. In fact, some errors are intentionally induced so that users will become comfortable with the "debugging" phase of model creation. At the end of each lesson is a short quiz reviewing the new topics covered in that chapter. Following the quiz are several simple "exercise" parts that can be created using new commands taught in that lesson. In addition to these an ongoing project throughout the book is also included. This project consists of several parts that are introduced with the early lessons and finally assembled at the end.
