Research investigates rigless well abandonment procedures ...

Rigless Well Stimulation using an MSV -Case study • Subsea wells can encounter permeability inhibitive sediments which reduce or stop the flow of production.

# Read PDF Rigless Well Intervention Reduces Water

- Well stimulation is a type of well intervention used to pump diluted acid mixtures into the well.

---

Rigless Well Stimulation using an MSV - Case study Using the testing facilities at our Houston site and then working alongside some of the major oil corporates, in offshore environments across the globe, we have invented an effective water shut off solution, which reduces water cut and increases oil production, even in wells that previously produced 100% water.

more complex and expensive environments - namely subsea and deepwater. Best-fit connection

---

Offshore - July 2017

Traditional methods of reducing water production from a well included setting multiple bridge plugs in the production string or perforating the production string and squeezing cement or a resin. Bridge plugs only baffle the water, slowing it down but not stopping it, as they cannot seal the annulus outside of the production string. Resins require perforations to access the annulus,

# Read PDF Rigless Well Intervention Reduces Water damaging the production string.
