Vector Control of Three-Phase Active Front End Rectifier

Simulation of an Active front end rectifier. This is a AC-DC converter with a very low THD input current and capable handle bidirectional power. The power factor can be adjust from 0 to 1. The simulation contemplates online increase/decrease of load and switch from generating to regenerating mode.

Active front end rectifier—File Exchange—MATLAB Central

IGBTs are devices whose switching is controlled electronically ll hence the term llactive ll front end. The active front end monitors the input current waveform and shapes it to be sinusoidal, reducing total harmonic distortion (THD) to 5 percent or less. (Note that THD is only measured for lower-order harmonics.
