The WRF model is used and it is evaluated with surface observations that are independent of model integrations allowing us to study model representations of the diurnal cycle. The period chosen (December 2002–February 2003) provides a dense observation network over central South America obtained during the South America Low-Level Jet Experiment (SALLJEX; Vera et al. 2006).

Biases in the WRF wind speed estimates were very sensitive to model spatial resolution. This was mainly because higher resolution improved the representation of terrain elevation. The sign of the bias depended on terrain morphology and the spatial resolution, but absolute values tended to be much higher with coarser spatial resolution (9 km).

The WRF model is also sensitive to the choice of downscaling ratio. When one-way nesting is used, a coarse-to-fine grid integer ratio of 5 or less is recommended (Powers et al., 2008). To avoid a steep downscaling ratio which may lead to poor performance and unstable model runs (Liu et al., 2012), the moderate downscaling ratio of 3 was picked.
